

# Delivery Monitoring App (iPhone and iPad)

## Introduction

Imobisoft have developed a specialised delivery monitoring application that allows businesses to keep a live record of what deliveries have been made and how much stock they currently have. The mobile application is fully flexible and can be tailored towards specific client needs, however it follows a general framework that we feel can be useful to any business that needs to deliver to clients.

The application is split into two sections, one for the administrators of the business and one for the delivery drivers. Each user can access different areas of functionality within the app.

## Admin

The admin will have the main level of control in regards to assigning deliveries to drivers and maintaining control of the stock room. After entering a unique username and password they are taken to a dashboard that enables the admin to access various other features. These include;

- Sell Products (Allows the client to sell their products instantly to any potential client)
- Add to Storage (Allows the client to add products to their storage database upon purchase)
- Check Storage (Allows the client to check what products are in their storage database)
- Check Returns (Checks which products have been returned after a full day of deliveries)
- Reports (Allows the client to check reports on the previous day's deliveries)
- Also allows them to assign the deliveries for the next day)
- Add a Van (Allows the client to add a new van and driver, which can then be

## Drivers

The driver will mainly use the mobile application both to check what stock they need to load into the van and to update the stock system at the end of a day of deliveries. This portion of the application features the following options;

- Load Van (Allows the driver to see what needs to be placed in the van for the day)
- Check Stock (Allows the driver to check stock levels to ensure they are adequate for deliveries)
- Return Stock (Allows the driver to record which stock they have returned with at the end of the day so that it can be added back to the stock database)
- Reports (Allows for creation of a report relating to the day's deliveries)

The application can be tailored depending on client requirements; however its base functionality ensures that the process of deliveries and stock taking are carried out quickly and easily
